Section 1 : Coding

1. Problem Statement:

"Write a program that helps identify the type of a triangle based on the lengths of its three sides. The program prompts the user to input the lengths of sides 'a', 'b', and 'c', and then it classifies the triangle as 'Equilateral' if all sides are equal, 'Isosceles' if two sides are equal, or 'Scalene' if all sides are different. Can you provide the Java code for this task?"

Input Format

The first line of the input is an integer 'a' representing the length of side 'a.'

The second line of the input is an integer 'b' representing the length of side 'b.'

The third line of the input is an integer 'c' representing the length of side 'c.'

Output Format

The program outputs a single line that specifies the type of the triangle:
"Equilateral," "Isosceles," or "Scalene."

Sample Test Case

Input: 3

4

5

Output: The triangle is Scalene

Answer

```
import java.util.Scanner;
```

```
public class Main {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);
```

```
  
        int a = scanner.nextInt();  
        int b = scanner.nextInt();  
        int c = scanner.nextInt();
```

```
  
        if (a == b && b == c) {
```

```
            System.out.println("The triangle is Equilateral");  
        } else if (a == b || b == c || a == c) {
```

```
            System.out.println("The triangle is Isosceles");  
        } else {
```

```
            System.out.println("The triangle is Scalene");  
        }
```

```
        scanner.close();  
    }  
}
```

Status : Correct

Marks : 10/10

2. Problem Statement

In a logistics company, each delivery pack contains a specific number of items, and the priority customer receives double the amount. Write a program to determine the total number of delivery packs required for the operation, considering the number of items per pack and the number of customers given as input by the user.

Example

Input:

Number of items per pack = 96

Number of customers = 8

Output:

10

Explanation:

Given the number of items per pack = 96 and the number of customers = 8, the calculations are as follows:

Total number of items needed = number of items per pack * number of customers = $96 * 8 = 768$. Priority customer's share = double the amount of items per pack = $2 * 96 = 192$. Total items with the priority customer = total items needed + priority share = $768 + 192 = 960$. Number of packs needed = $(960 + 96 - 1) / 96 = 10.98$. Since we cannot have a fraction of a pack, the output is 10.

Input Format

The input consists of two space-separated integers N and C, representing the number of items per pack and the number of customers.

Output Format

The output displays an integer, representing the total number of delivery packs required for the operation.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1 1

Output: 3

Answer

```
import java.util.Scanner;

public class Main{
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        int N = scanner.nextInt();
        int C = scanner.nextInt();

        int totalItemsForCustomers = N * C;

        int priorityCustomerItems = 2 * N;

        int totalItems = totalItemsForCustomers + priorityCustomerItems;

        int packsNeeded = (totalItems + N - 1) / N;

        System.out.println(packsNeeded);

        scanner.close();
    }
}
```

Status : Correct

Marks : 10/10

3. Problem Statement:

Gilbert is tasked with writing a program that checks whether a given

integer is an odd number. An odd number is one that cannot be exactly divided by 2. The program should take an integer as input and determine if it is an odd number or not. The task is to implement the logic to check if the provided integer is odd and return the result.

Input Format

The first line of the input contains an integer, "input".

Output Format

The output should display a boolean value, "result," which should be set to true if the input integer is an odd number and false if it is even.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 0

Output: Is the integer odd? false

Answer

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        int input = scanner.nextInt();

        boolean result = (input % 2 != 0);

        System.out.println("Is the integer odd? " + result);

        scanner.close();
    }
}
```

Status : Correct

Marks : 10/10

4. PROBLEM STATEMENT:

Julia a mathematician expert is given two integers to find if the second integer is above the average of the first and second integer. Write a program that achieves this using the ternary operator.

Input Format

The first line of input represents the first integer.

The second line of input represents the second integer.

Output Format

The output should be displayed as "Below Average" or "Above Average"

REFER THE SAMPLE TESTCASES FOR THE FORMAT SPECIFICATIONS.

Sample Test Case

Input: 1

1

Output: Below Average

Answer

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        int first = scanner.nextInt();
        int second = scanner.nextInt();

        double average = (first + second) / 2.0;
```

```
String result = (second > average) ? "Above Average" : "Below Average";  
System.out.println(result);
```

```
    scanner.close();  
}  
}
```

1. Problem Statement

Arun is working on a project to automate the process of determining whether a student has passed or failed based on their subject marks.

He aims to create a simple program that takes positive integers as marks for five subjects from the user. If the average of the marks is greater than or equal to 50, the student has passed the exam. Otherwise, the student has failed.

Help Arun to implement the project.

Input Format

The input consists of five space-separated integers, representing the marks in five subjects.

Output Format

The first line of output prints "Average score: " followed by an integer representing the average score.

The second line prints one of the following:

1. If the condition is satisfied, print "The student has passed".
2. Otherwise, the output prints "The student has failed".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 50 60 70 80 90

Output: Average score: 70

The student has passed

Answer

```
import java.util.Scanner;
```

```
public class Main {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);
```

```
        int subject1 = scanner.nextInt();  
        int subject2 = scanner.nextInt();  
        int subject3 = scanner.nextInt();  
        int subject4 = scanner.nextInt();  
        int subject5 = scanner.nextInt();
```

```
        int average = (subject1 + subject2 + subject3 + subject4 + subject5) / 5;
```

```
        System.out.println("Average score: " + average);
```

```
        if (average >= 50) {
```

```
        System.out.println("The student has passed");
    } else {
        System.out.println("The student has failed");
    }
}
}

1. Problem Statement

Samantha is a diligent math student who is exploring the world of programming. She is learning Java and has recently studied conditional statements. One day, her teacher gives her an interesting problem to solve, which takes a number as input and checks whether it is a multiple of 5 or 7.

Help her complete the task.

Input Format

The input consists of a single integer N, representing the number to be checked.

Output Format

If the number is a multiple of 5 but not 7, the output prints "N is a multiple of 5"

If the number is a multiple of 7, the output prints "N is a multiple of 7".

Otherwise the output prints "N is neither multiple of 5 nor 7" where N is an entered integer.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 10

Output: 10 is a multiple of 5

Answer

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        int N = scanner.nextInt();

        if (N % 5 == 0 && N % 7 != 0) {
            System.out.println(N + " is a multiple of 5");
        } else if (N % 7 == 0) {
            System.out.println(N + " is a multiple of 7");

1. Problem Statement

John is a fitness trainer, and he wants to use the BMI calculator to assess the body mass index of his clients. He has a list of clients based on their height and weight.

John plans to write a program to quickly determine the BMI and provide a classification for each client.

If BMI is less than 18.5, the program will classify it as "Underweight" If BMI is between 18.6 and 24.9, the program will classify it as "Normal Weight" If BMI is between 25.0 and 29.9, the program will classify it as "Overweight" If BMI is 30.0 or higher, the program will classify it as "Obese"

Note: Formula to calculate BMI = $\text{weight}/(\text{height} \times \text{height})$

Input Format

The first line of input consists of a double value, representing the height of the person in meters.

The second line consists of a double value, representing the weight of the person in kilograms.

Output Format

The first line of output prints "BMI: " followed by a double (rounded to two decimal places) representing the calculated BMI.

The second line prints "Classification: " followed by a string indicating the BMI category (Underweight, Normal Weight, Overweight, or Obese).

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1.2

45.2

Output: BMI: 31.39

Classification: Obese

Answer

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double height = scanner.nextDouble();
        double weight = scanner.nextDouble();

        double bmi = weight / (height * height);

        bmi = Math.round(bmi * 100.0) / 100.0;
```

```
String classification;  
if (bmi < 18.5) {  
    classification = "Underweight";  
} else if (bmi >= 18.5 && bmi <= 24.9) {  
    classification = "Normal Weight";  
} else if (bmi >= 25.0 && bmi <= 29.9) {  
    classification = "Overweight";  
} else {  
    classification = "Obese";  
}
```

```
System.out.printf("BMI: %.2f\n", bmi);  
System.out.println("Classification: " + classification);  
}  
}
```

1. Problem Statement

Amit wants to evaluate the depreciation of his car over time to understand its current value and categorize it based on that value.

Write a program that helps him determine the current value of his car after a certain number of years of depreciation and classify it into one of three categories:

High: If the current value is greater than 10,000. Medium: If the current value is between 5,000 and 10,000, both inclusive. Low: If the current value is less than 5,000.

The depreciation rate of the car is 15% per year. The program should calculate the current value of the car after applying this depreciation over the given number of years and print the current value along with the category.

Input Format

The first line of input consists of an integer, representing the initial cost of the car.

The second line consists of an integer, representing the number of years the car has been depreciating.

Output Format

The first line of output prints a double value, representing the current value of the car, rounded off to two decimal places "Current Value: <value>".

The second line prints its category "Category: <categories>".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 20000
5

Output: Current Value: 8874.11
Category: Medium

Answer

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double initialCost = scanner.nextDouble();
        int years = scanner.nextInt();

        double currentValue = initialCost * Math.pow(0.85, years);

        currentValue = Math.round(currentValue * 100.0) / 100.0;

        String category;
```

```
        if (currentValue > 10000) {  
            category = "High";  
        } else if (currentValue >= 5000) {  
            category = "Medium";  
        } else {  
            category = "Low";  
        }  
  
        System.out.printf("Current Value: %.2f\n", currentValue);  
        System.out.println("Category: " + category);

1. Problem Statement

Ted, the computer science enthusiast, has accepted the challenge of writing a program that checks if the number of digits in an integer matches the sum of its digits.

Guide Ted in designing and writing the code to solve this problem using a 'do-while' loop.

Input Format

The input consists of an integer N, representing the number to be checked.

Output Format

If the sum is equal to the number of digits, print "The number of digits in N matches the sum of its digits."

Else, print "The number of digits in N does not match the sum of its digits."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 20

Output: The number of digits in 20 matches the sum of its digits.

Answer

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int N = scanner.nextInt();
        int originalN = N;

        int digitCount = 0;
        int digitSum = 0;

        do {
            digitSum += N % 10;
            digitCount++;
            N /= 10;
        } while (N != 0);

        if (digitSum == digitCount) {
            System.out.printf("The number of digits in %d matches the sum of its\n", originalN);
        } else {
            System.out.printf("The number of digits in %d does not match the sum of\n", originalN);
        }
    }

Section 1 : Coding

1. Problem Statement

You are given a number of distribution centers (rows) and are tasked with generating a zigzag shipment route pattern. Each shipment route should alternate between left-to-right and right-to-left, as described below.

The program should print the zigzag pattern with a tab (\t) separating the columns. For each row, the shipment numbers should follow a diagonal pattern where numbers are placed in a zigzag, left to right on odd rows and right to left on even rows.

Input Format

The input consists of an integer N, which represents the number of distribution centers (rows) for the zigzag pattern.

Output Format

The output prints the zigzag pattern with N rows, formatted with a tab space (\t) separating the columns.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5

Output: 1
 2 6
 3 7 10
 4 8 11 13
 5 9 12 14 15

Answer

```
import java.util.Scanner;

public class Main{
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int N = scanner.nextInt();
        int[][] pattern = new int[N][N];
        int currentNumber = 1;

        for (int sum = 0; sum <= 2 * (N - 1); sum++) {
            if (sum % 2 == 0) {

                for (int i = Math.min(sum, N - 1); i >= 0; i--) {
                    int j = sum - i;
                    if (j >= 0 && j < N) {
                        pattern[i][j] = currentNumber++;
                    }
                }
            } else {

                for (int i = 0; i <= Math.min(sum, N - 1); i++) {
                    int j = sum - i;
```

```

        if (j >= 0 && j < N) {
            pattern[i][j] = currentNumber++;
        }
    }
}

for (int i = 0; i < N; i++) {
    for (int space = 0; space < N - i - 1; space++) {
        System.out.print("\t");
    }
    for (int j = 0; j <= i; j++) {
        System.out.print(pattern[i][j]);
        if (j < i) {
            System.out.print("\t\t");
        }
    }
    System.out.println();
}
}

```

Status : Wrong

Marks : 0/10

2. Problem Statement

Sampad is a high school teacher who wants to convert numeric grades into letter grades.

Write a program that accepts a numeric grade as input. The program should then convert this numeric grade into a letter grade based on specific conditions. The letter grades are A, B, C, D and F.

The conversion is determined by the following conditions:

If the numeric grade is 90 or higher, it's an "A"
 If the numeric grade is between 80 and 89 (inclusive), it's a "B"
 If the numeric grade is between 70 and 79 (inclusive), it's a "C"
 If the numeric grade is between 60 and 69

(inclusive), it's a "D" If the numeric grade is below 60, it's an "F"

Input Format

The input consists of an integer representing the numeric grade of the student.

Output Format

The output prints the letter grade corresponding to the input numeric grade as "Letter Grade: <grade>".

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 85

Output: Letter Grade: B

Answer

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int numericGrade = scanner.nextInt();
        String letterGrade;

        if (numericGrade >= 90) {
            letterGrade = "A";
        } else if (numericGrade >= 80) {
            letterGrade = "B";
        } else if (numericGrade >= 70) {
            letterGrade = "C";
        } else if (numericGrade >= 60) {
            letterGrade = "D";
        } else {
            letterGrade = "F";
        }

        System.out.println("Letter Grade: " + letterGrade);
    }
}
```

Status : Correct

Marks : 10/10

3. Problem Statement

Rohit is tasked with designing a program to analyze the digits of a given integer.

Write a program to help Rohit that takes an integer as input and identifies the minimum odd digit and the maximum even digit present in the number. If no odd or even digits are present, display appropriate messages.

Implement the solution using a 'while' loop to iterate through the digits of the given number.

Input Format

The input consists of an integer n.

Output Format

The first line of output prints the message "Minimum odd digit: " followed by an integer representing the smallest odd digit found in the input number.

If no odd digit exists, it prints "There are no odd digits in the number."

The second line of output prints the message "Maximum even digit: " followed by an integer representing the largest even digit found in the input number.

If no even digit exists, it prints "There are no even digits in the number."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 3465

Output: Minimum odd digit: 3

Maximum even digit: 6

Answer

```
import java.util.Scanner;
```

```
public class Main {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);  
        int n = scanner.nextInt();  
        int minOdd = Integer.MAX_VALUE;  
        int maxEven = Integer.MIN_VALUE;  
        boolean hasOdd = false;  
        boolean hasEven = false;
```

```
        if (n == 0) {
```

```
            hasEven = true;  
            maxEven = 0;  
        } else {
```

```
            int temp = Math.abs(n);
```

```
            while (temp > 0) {
```

```
                int digit = temp % 10;
```

```
                if (digit % 2 != 0) {
```

```
                    hasOdd = true;
```

```
                    if (digit < minOdd) {  
                        minOdd = digit;
```

```
                    }
```

```
                } else {
```

```
                    hasEven = true;
```

```
                    if (digit > maxEven) {  
                        maxEven = digit;
```

```
                    }
```

```
                }
```

```
                temp /= 10;
```

```
            }
```

```
        }
```

```
        if (hasOdd) {
```

```
            System.out.println("Minimum odd digit: " + minOdd);
```

```
        } else {
```

```
            System.out.println("There are no odd digits in the number.");
```

```
        }
```

```
    if (hasEven) {  
        System.out.println("Maximum even digit: " + maxEven);  
    } else {  
        System.out.println("There are no even digits in the number.");  
    }  
}  
}
```

Marks : 10/10

4. Problem Statement

Ravi wants to estimate the total utility bill for a household based on the consumption of electricity, water, and gas.

Write a program to calculate the total bill using the following criteria:

The cost per unit for electricity is 0.12, for water is 0.05, and for gas is 0.08. A discount is applied to the total cost based on the following conditions: If the total cost is 100 or more, a 10% discount is applied. If the total cost is between 50 and 99.99, a 5% discount is applied. No discount is applied if the total cost is less than 50.

The program should output the total bill after applying the discount with two decimal places.

Input Format

The input consists of three double values, representing the number of units consumed for electricity, water, and gas respectively.

Output Format

The output prints a double value, representing the total bill after applying the discount, formatted to two decimal places.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1000.0

200.0

100.0

Output: 124.20

Answer

```
import java.util.Scanner;
```

```
public class Main {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);
```

```
        double electricityUnits = scanner.nextDouble();  
        double waterUnits = scanner.nextDouble();  
        double gasUnits = scanner.nextDouble();
```

```
        double electricityCost = electricityUnits * 0.12;  
        double waterCost = waterUnits * 0.05;  
        double gasCost = gasUnits * 0.08;
```

```
        double totalCost = electricityCost + waterCost + gasCost;
```

```
        double discount = 0.0;  
        if (totalCost >= 100.0) {  
            discount = totalCost * 0.10;  
        } else if (totalCost >= 50.0) {  
            discount = totalCost * 0.05;  
        }
```

```
        double totalBill = totalCost - discount;
```

```
        System.out.printf("%.2f", totalBill);
```

```
    }  
}
```

1. Problem Statement

Joe has a favourite number, let's call it X. He wants to check if X is divisible by the sum of its digits. If it is, he considers it a lucky number. If not, he wants to find the closest smaller number, that is divisible by the sum of digits of X. Joe has challenged his friends to solve this puzzle at his birthday party.

Example

Input:

157

Output:

157 is not divisible by the sum of its digits.

The closest smaller number that is divisible: 156

Explanation:

The sum of the digits of X is $1+5+7=13$. Since 157 is not divisible by 13, we need to find the closest smaller number that is divisible by 13. 156 is divisible by 13, it is the closest smaller number that meets the requirement.

Input Format

The input consists of an integer X, representing Joe's favourite number.

Output Format

If X is a lucky number, then the output must be in the format: "X is divisible by the sum of its digits."

If not, then the output must be in the format:

"X is not divisible by the sum of its digits."

The closest smaller number that is divisible: Y",

where X is the entered number and Y is the closest number.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 120

Output: 120 is divisible by the sum of its digits.

Answer

```
import java.util.Scanner;
```

```
public class Main {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);  
        int X = scanner.nextInt();  
        int originalX = X;  
        int sum = 0;
```

```

while (X > 0) {
    sum += X % 10;
    X /= 10;
}

X = originalX;

if (sum == 0) {
    System.out.println(X + " is divisible by the sum of its digits.");
    return;
}

if (X % sum == 0) {
    System.out.println(X + " is divisible by the sum of its digits.");
} else {
    int closestNumber = X - (X % sum);
    System.out.println(X + " is not divisible by the sum of its digits.");
    System.out.println("The closest smaller number that is divisible: " +
closestNumber);
}
}
}

```

Marks : 10/10

2. Problem Statement

Ram wants to evaluate the time required to break even on an investment based on initial costs, monthly profits, and monthly expenses. Write a program to calculate the break-even point in months and categorize the return on investment.

Compute the break-even point by using the formula: $\text{initial cost} / (\text{monthly profit} - \text{monthly expenses})$. Based on the break-even point, classify the return on investment into one of the following categories: Quick Return: If the break-even point is 3 months or fewer. Average Return: If the break-even point is between 4 and 12 months, inclusive. Long-term Return: If the break-even point exceeds 12 months.

Ram is new to programming, so he seeks your assistance in creating the program.

Note: monthly profit is always greater than monthly expenses.

Input Format

The first line of input consists of a double value representing the initial cost.

The second line consists of a double value representing the monthly profit.

The third line consists of a double value representing the monthly expenses.

Output Format

The first line prints "Break-even Point:", followed by the break-even point as a decimal number (of double datatype), formatted to two decimal places.

The second line prints "Category: ", followed by the investment return as a String, which can be one of:

- "Quick Return" if break-even point ≤ 3
- "Average Return" if break-even point ≤ 12
- "Long-term Return" if break-even point > 12

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 10000.50

5000.75

1000.10

Output: Break-even Point: 2.50

Category: Quick Return

Answer

```
import java.util.Scanner;
```

```
public class Main {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);
```

```

double initialCost = scanner.nextDouble();
double monthlyProfit = scanner.nextDouble();
double monthlyExpenses = scanner.nextDouble();

double netMonthlyProfit = monthlyProfit - monthlyExpenses;

double breakEvenPoint = initialCost / netMonthlyProfit;

String category;
if (breakEvenPoint <= 3.0) {
    category = "Quick Return";
} else if (breakEvenPoint <= 12.0) {
    category = "Average Return";
} else {
    category = "Long-term Return";
}

System.out.printf("Break-even Point: %.2f\n", breakEvenPoint);
System.out.println("Category: " + category);
}
}

```

3. Problem Statement

Noah is analyzing numbers within a given range [A, B] and wants to calculate a special sum. For each number in the range, he calculates the product of its odd digits (ignoring even digits). If the number contains no odd digits, it is skipped. The sum of these products for all numbers in the range is the result.

Write a program to compute this sum.

Example

Input:

10 12

Output:

3

Explanation:

For 10, odd digits = 1, product = 1.

For 11, odd digits = 1, 1, product = $1 * 1 = 1$.

For 12, odd digits = 1, product = 1.

Total sum = $1 + 1 + 1 = 3$

Input Format

The input consists of two space-separated integers A and B, representing the inclusive range boundaries.

Output Format

The output prints a single integer representing the sum of the products of odd digits for all numbers in the range.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 10 12

Output: 3

Answer

```
import java.util.Scanner;
```

```
public class Main {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);  
        int A = scanner.nextInt();
```

```
int B = scanner.nextInt();
int totalSum = 0;

for (int num = A; num <= B; num++) {
    int currentNum = num;
    int product = 1;
    boolean hasOddDigits = false;

    while (currentNum > 0) {
        int digit = currentNum % 10;
        if (digit % 2 != 0) {
            product *= digit;
            hasOddDigits = true;
        }
        currentNum /= 10;
    }

    if (hasOddDigits) {
        totalSum += product;
    }
}

System.out.println(totalSum);
}
```

4. Problem Statement

Samantha is a diligent math student who is exploring the world of programming. She is learning Java and has recently studied conditional statements. One day, her teacher gives her an interesting problem to solve, which takes a number as input and checks whether it is a multiple of 5 or 7.

Help her complete the task.

Input Format

The input consists of a single integer N, representing the number to be checked.

Output Format

If the number is a multiple of 5 but not 7, the output prints "N is a multiple of 5".

If the number is a multiple of 7, the output prints "N is a multiple of 7".

Otherwise the output prints "N is neither multiple of 5 nor 7" where N is an entered integer.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 10

Output: 10 is a multiple of 5

Answer

```
import java.util.Scanner;
```

```
public class Main {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);  
        int N = scanner.nextInt();  
  
        if (N % 5 == 0 && N % 7 != 0) {  
            System.out.println(N + " is a multiple of 5");  
        } else if (N % 7 == 0) {  
            System.out.println(N + " is a multiple of 7");  
        } else {  
            System.out.println(N + " is neither multiple of 5 nor 7");  
        }  
    }  
}
