## 2024\_28\_III\_OOPS Using Java Lab

### REC\_2028\_OOPS using Java\_Week 10\_MCQ

Attempt : 1

Total Mark : 15

Marks Obtained : 15

#### **Section 1 : MCQ**

1. How does HashSet check for duplicate elements?

**Answer**

Using equals() and hashCode()

**Status : Correct**

**Marks : 1/1**

2. Which of the following allows null keys in Java?

**Answer**

HashMap

**Status : Correct**

**Marks : 1/1**

3. Which statement is true about HashSet and TreeSet?

**Answer**

TreeSet provides sorted elements

**Status : Correct**

**Marks : 1/1**

4. What happens if two keys have the same hash code in a HashMap?

**Answer**

A linked list is used to store values with the same hash

**Status : Correct**

**Marks : 1/1**

5. Which of the following is true about HashMap?

**Answer**

It is not synchronized

**Status : Correct**

**Marks : 1/1**

6. What will be the output of the following code?

```
import java.util.*;
class Main {
    public static void main(String[] args) {
        HashMap<String, Integer> map = new HashMap<>();
        map.put("A", 1);
        map.put("B", 2);
        map.put("C", 3);
        System.out.println(map.containsKey("B"));
    }
}
```

**Answer**

true

**Status : Correct**

**Marks : 1/1**

7. What is the time complexity of retrieving an element from a HashSet?

**Answer**

O(1)

**Status : Correct**

**Marks : 1/1**

8. What will be the output of the following code?

```
import java.util.*;
class Main {
    public static void main(String[] args) {
        HashMap<String, Integer> map = new HashMap<>();
        map.put("X", 10);
        map.put("Y", 20);
        map.put("Z", 30);
        map.remove("Y");
        System.out.println(map);
    }
}
```

**Answer**

{X=10, Z=30}

**Status : Correct**

**Marks : 1/1**

9. Which method retrieves the lowest key in a TreeMap?

**Answer**

firstKey()

**Status : Correct**

**Marks : 1/1**

10. What happens when you add duplicate elements to a HashSet?

**Answer**

The duplicate is ignored

Status : Correct

Marks : 1/1

11. What will happen if you add elements in descending order in a TreeSet?

**Answer**

They are sorted in ascending order

Status : Correct

Marks : 1/1

12. Which of the following is true about TreeMap?

**Answer**

It maintains natural ordering

Status : Correct

Marks : 1/1

13. What will happen if you add a null element to a TreeSet?

**Answer**

An exception occurs

Status : Correct

Marks : 1/1

14. What will be the output of the following code?

```
import java.util.*;
class Main {
    public static void main(String[] args) {
        HashMap<String, String> map = new HashMap<>();
        map.put("A", "Apple");
        map.put("B", "Banana");
        map.put("C", "Cherry");
        map.replace("B", "Blueberry");
        System.out.println(map);
    }
}
```

}

**Answer**

{A=Apple, B=Blueberry, C=Cherry}

**Status :** Correct

**Marks :** 1/1

15. Which method removes all elements from a Set?

**Answer**

clear()

**Status :** Correct

**Marks :** 1/1

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 10\_Q1

Attempt : 1

Total Mark : 10

Marks Obtained : 0

#### **Section 1 : COD**

##### **1. Problem Statement**

A city traffic management system needs to track vehicles entering a toll booth. Each vehicle is uniquely identified by its registration number. The system should allow adding vehicles to a record, ensuring that no duplicate registration numbers exist. The vehicles should be stored in a HashSet, which does not guarantee any specific order.

Your task is to implement a program using a HashSet that allows adding vehicle details and displaying the records.

##### ***Input Format***

The first line of input contains an integer N - the number of vehicles.

The next N lines contain details of each vehicle in the format: "RegNumber

OwnerName VehicleType"

1. RegNumber (String) - A unique registration number (Alphanumeric).
2. OwnerName (String) - The name of the vehicle owner.
3. VehicleType (String, Car, Bike, or Truck) - The type of vehicle.

If a vehicle with the same registration number is already present, ignore the duplicate entry.

### ***Output Format***

The output prints the unique vehicle records in any order (since HashSet does not maintain order).

Output format: "RegNumber OwnerName VehicleType"

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 5

KA01AB1234 John Car

MH02CD5678 Alice Bike

DL03EF9012 Bob Truck

TN04GH3456 Mike Car

KA01AB1234 John Car

Output: TN04GH3456 Mike Car

KA01AB1234 John Car

MH02CD5678 Alice Bike

DL03EF9012 Bob Truck

### ***Answer***

```
import java.util.HashSet;
import java.util.Scanner;
```

```
class Main {
```

```
    String regNumber;
```

```
    String ownerName;
```

```
    String vehicleType;
```

```
    public Vehicle(String regNumber, String ownerName, String vehicleType) {
```

```
this.regNumber = regNumber;
this.ownerName = ownerName;
this.vehicleType = vehicleType;
}

@Override
public String toString() {
    return regNumber + " " + ownerName + " " + vehicleType;
}

@Override
public boolean equals(Object obj) {
    if (this == obj) return true;
    if (obj == null || getClass() != obj.getClass()) return false;
    Vehicle other = (Vehicle) obj;
    return regNumber.equals(other.regNumber);
}

@Override
public int hashCode() {
    return regNumber.hashCode();
}
}

public class TollBoothTracker {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int n = Integer.parseInt(scanner.nextLine());

        HashSet<Vehicle> vehicles = new HashSet<>();

        for (int i = 0; i < n; i++) {
            String[] parts = scanner.nextLine().split(" ");
            String regNumber = parts[0];
            String ownerName = parts[1];
            String vehicleType = parts[2];

            vehicles.add(new Vehicle(regNumber, ownerName, vehicleType));
        }

        for (Vehicle v : vehicles) {
            System.out.println(v);
        }
    }
}
```

241901012  
}

**Status : Wrong**

### 2028\_REC\_OOPS using Java\_Week 10\_Q2

Attempt : 1

Total Mark : 10

Marks Obtained : 0

#### **Section 1 : COD**

##### **1. Problem Statement**

John is organizing a fruit festival, and the quantities of various fruits are stored in a HashMap where fruit names are keys and quantities are values.

Help him develop a program to find the total quantity of fruits for the festival by summing up the values in the HashMap.

##### ***Input Format***

The input consists of fruit quantities in the format 'fruitName:quantity', where fruitName is the name of the fruit(a string), and quantity is a double value representing the quantity.

The input is terminated by entering "done".

##### ***Output Format***

The output prints a double value, representing the sum of values in the HashMap, rounded off to two decimal places.

If the value is not numeric, print "Invalid input".

If any special characters other than ':' are entered, print "Invalid format".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: Banana:15.2

Orange:56.3

Mango:47.3

done

Output: 118.80

### **Answer**

```
import java.util.HashMap;
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        HashMap<String, Double> fruitMap = new HashMap<>();

        while (true) {
            String input = scanner.nextLine();

            if (input.equals("done")) {
                break;
            }

            if (!input.contains(":") || input.contains(" ") || input.matches(".*[^a-zA-Z0-9:]*")) {
                System.out.println("Invalid format");
                return;
            }

            String[] parts = input.split(":");
        }
    }
}
```

```
if (parts.length != 2) {  
    System.out.println("Invalid format");  
    return;  
}  
  
String fruit = parts[0];  
String quantityStr = parts[1];  
  
try {  
    double quantity = Double.parseDouble(quantityStr);  
    fruitMap.put(fruit, quantity);  
} catch (NumberFormatException e) {  
    System.out.println("Invalid input");  
    return;  
}  
}
```

### 2028\_REC\_OOPS using Java\_Week 10\_Q3

Attempt : 1

Total Mark : 10

Marks Obtained : 10

#### **Section 1 : COD**

##### **1. Problem Statement**

Priya is analyzing encrypted messages in a research project. She wants to analyze the frequency of each character in a given paragraph. The characters should be stored in a TreeMap so that the output is sorted in ascending order of characters automatically.

You are required to build a Java program that:

Uses a TreeMap<Character, Integer> to count how many times each character appears in the message.Ignores spaces and considers only alphabets (case-sensitive).Outputs the frequencies of characters in sorted order.

You must use a TreeMap in the class named MessageAnalyzer.

#### ***Input Format***

The first line of input contains an integer n, the number of lines in the message.

The next n lines each contain a string (the encrypted message line).

### ***Output Format***

The first line of output prints: "Character Frequency:"

Then print each character and its frequency in the format: "<character>: <count>"

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 2

Hello World

Java

Output: Character Frequency:

H: 1

J: 1

W: 1

a: 2

d: 1

e: 1

l: 3

o: 2

r: 1

v: 1

### ***Answer***

```
import java.util.Scanner;
import java.util.TreeMap;

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int n = Integer.parseInt(scanner.nextLine());

        TreeMap<Character, Integer> frequencyMap = new TreeMap<>();

        for (int i = 0; i < n; i++) {
```

```
String line = scanner.nextLine();

for (char ch : line.toCharArray()) {
    if (Character.isLetter(ch)) {
        frequencyMap.put(ch, frequencyMap.getOrDefault(ch, 0) + 1);
    }
}

System.out.println("Character Frequency:");
for (char ch : frequencyMap.keySet()) {
    System.out.println(ch + ": " + frequencyMap.get(ch));
}
}
```

**Status :** Correct

#### **Section 1 : COD**

##### **1. Problem Statement**

In a ticket reservation system, you store the available seat numbers in a TreeSet. Users input their desired seat number, and the program checks whether the chosen seat is available.

Using a TreeSet ensures quick and efficient verification of seat availability, ensuring a smooth and organized ticket booking process.

##### ***Input Format***

The first line of input contains a single integer n, representing the number of available seats.

The second line contains n space-separated integers, representing the available seat numbers.

The third line contains an integer m, representing the seat number that needs to be searched.

### ***Output Format***

The output displays "[m] is present!" if the given seat is available. Otherwise, it displays "[m] is not present!"

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 4

2 4 5 6

5

Output: 5 is present!

### ***Answer***

```
import java.util.Scanner;
import java.util.Set;
import java.util.TreeSet;

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int n = scanner.nextInt();

        Set<Integer> availableSeats = new TreeSet<>();

        for (int i = 0; i < n; i++) {
            int seat = scanner.nextInt();
            availableSeats.add(seat);
        }

        int m = scanner.nextInt();

        if (availableSeats.contains(m)) {
            System.out.println(m + " is present!");
        } else {
            System.out.println(m + " is not present!");
        }
    }
}
```

### **Section 1 : Coding**

#### **1. Problem Statement**

A university maintains a list of student records and wants to store them in a sorted manner based on their GPA. If two students have the same GPA, they should be further sorted by their name in lexicographical order.

Implement a program that uses a TreeSet to store student records and ensures unique student IDs.

#### ***Input Format***

The first line contains an integer N - the number of students.

The next N lines contain details of each student in the format: "StudentID Name GPA"

- StudentID (Integer) - A unique identifier.
- Name (String) - The student's name (can contain spaces).

- GPA (Double) - The Grade Point Average.

### **Output Format**

The output prints the list of students in ascending order of GPA.

If two students have the same GPA, sort them by name.

Print details in the format: "StudentID Name GPA" in the output, GPA is rounded to two decimal places.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5

101 John 8.5

102 Alice 9.1

103 Bob 8.5

104 Zoe 7.3

105 Charlie 9.1

Output: 104 Zoe 7.30

103 Bob 8.50

101 John 8.50

102 Alice 9.10

105 Charlie 9.10

### **Answer**

```
import java.util.*;
class Student implements Comparable<Student> {
    int studentID;
    String name;
    double gpa;

    public Student(int studentID, String name, double gpa) {
        this.studentID = studentID;
        this.name = name;
        this.gpa = gpa;
    }

    public int compareTo(Student other) {
```

```

        if (this.gpa != other.gpa) {
            return Double.compare(this.gpa, other.gpa);
        }
        return this.name.compareTo(other.name);
    }

    public String toString() {
        return studentID + " " + name + " " + String.format("%.2f", gpa);
    }
}

class UniversityRecords {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        sc.nextLine();
        TreeSet<Student> studentSet = new TreeSet<>();
        for (int i = 0; i < n; i++) {
            int id = sc.nextInt();
            String name = sc.next();
            double gpa = sc.nextDouble();
            studentSet.add(new Student(id, name, gpa));
        }
        for (Student s : studentSet) {
            System.out.println(s);
        }
        sc.close();
    }
}

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Sarah is working on a spam detection system that analyzes incoming messages for unique patterns. Spammers often use repetitive character sequences, making it important to identify the first non-repeating character in a message.

Given a string, Sarah needs to determine the first character that appears only once. If all characters repeat, the system should return -1.

She decides to use a `HashMap` to efficiently track character frequencies and find the solution.

#### ***Input Format***

The first line contains an integer `N` representing , the length of the string.

The second line contains a string of `N` lowercase English letters (a-z).

#### ***Output Format***

The output prints a character representing the first non-repeating character. If none exist, print -1.

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 10  
abacabadac  
Output: d

#### ***Answer***

```
import java.util.*;  
class NonRepeatingCharacterFinder {  
  
    public char findFirstNonRepeatingCharacter(String str) {  
        HashMap<Character, Integer> charCount = new HashMap<>();  
  
        for (char ch : str.toCharArray()) {  
            charCount.put(ch, charCount.getOrDefault(ch, 0) + 1);  
        }  
  
        for (char ch : str.toCharArray()) {  
            if (charCount.get(ch) == 1) {  
                return ch;  
            }  
        }  
        return '\0';  
    }  
}
```

```

    }
}

class FirstNonRepeatingCharacter {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        int N = sc.nextInt();
        String str = sc.next();

        NonRepeatingCharacterFinder finder = new NonRepeatingCharacterFinder();
        char result = finder.findFirstNonRepeatingCharacter(str);

        if (result == '\0') {
            System.out.println(-1);
        } else {
            System.out.println(result);
        }

        sc.close();
    }
}

```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Riya is building a calendar event scheduler where each event is stored in chronological order using a TreeMap. The key represents the event time in 24-hour format (HH:MM), and the value is the event description.

She wants the system to:

Automatically sort events by time. Avoid duplicate time entries – if a duplicate time is entered, ignore the new entry. Print all scheduled events in order.

Implement this logic using a class named EventManager.

#### ***Input Format***

The first line of the input contains an integer n, representing the number of events.

The next n lines each contain a string in the format: "HH:MM Description"  
(Example: 09:00 TeamMeeting).

### ***Output Format***

The first line of the output prints "Scheduled Events:"

The next k lines print each event in the format: "HH:MM - Description"

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 5  
09:00 TeamMeeting  
13:30 LunchBreak  
11:00 ProjectUpdate  
09:00 Standup  
15:00 ClientCall

Output: Scheduled Events:

09:00 - TeamMeeting  
11:00 - ProjectUpdate  
13:30 - LunchBreak  
15:00 - ClientCall

### ***Answer***

```
import java.util.*;  
class EventManager {  
    TreeMap<String, String> schedule;  
  
    public EventManager() {  
        schedule = new TreeMap<>();  
    }  
  
    public void addEvent(String time, String description) {  
        if (!schedule.containsKey(time)) {  
            schedule.put(time, description);  
        }  
    }  
}
```

```
public void printSchedule() {
    System.out.println("Scheduled Events:");
    for (Map.Entry<String, String> entry : schedule.entrySet()) {
        System.out.println(entry.getKey() + " - " + entry.getValue());
    }
}
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine());

        EventManager manager = new EventManager();

        for (int i = 0; i < n; i++) {
            String line = sc.nextLine();
            int spaceIndex = line.indexOf(' ');
            String time = line.substring(0, spaceIndex);
            String desc = line.substring(spaceIndex + 1);
            manager.addEvent(time, desc);
        }

        manager.printSchedule();
    }
}
```

### REC\_2028\_OOPS using Java\_Week 10\_CY

Attempt : 1

Total Mark : 40

Marks Obtained : 40

#### **Section 1 : COD**

##### **1. Problem Statement**

The city library maintains a record of books available for lending. Each book is uniquely identified by its ISBN number, along with its title and author. The librarian wants to efficiently store and manage these records, ensuring books can be listed in the order they were added.

Your task is to implement a Library Management System using HashSet where:

The librarian adds books with ISBN, title, and author. The librarian can remove books by providing an ISBN. Finally, the librarian displays the available books in the order they were added.

Implement a class Library that will handle these operations. The main function should manage user input and interact with the Library class accordingly.

### ***Input Format***

The first line contains an integer n – the number of books to be added.

The next n lines contain three values: ISBN (integer), Title (string without spaces), and Author (string without spaces).

1. An integer employee\_id
2. A string title
3. A string author name

The next line contains an integer m – the number of books to be removed.

The next m lines follow, each contains an ISBN number to remove.

### ***Output Format***

The output prints a list of books available in the library after performing all operations in the format:

"ISBN: <isbn>, Title: <title>, Author: <author>"

If no books remain, print: "No books available"

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 3  
1234 JavaCompleteGuide JohnDoe  
5678 PythonBasics JaneDoe  
9012 DataStructures AliceSmith  
1  
5679

Output: ISBN: 1234, Title: JavaCompleteGuide, Author: JohnDoe  
ISBN: 9012, Title: DataStructures, Author: AliceSmith  
ISBN: 5678, Title: PythonBasics, Author: JaneDoe

### ***Answer***

```
import java.util.*;
```

```
class Book {  
    int isbn;  
    String title, author;  
  
    public Book(int isbn, String title, String author) {  
        this.isbn = isbn;  
        this.title = title;  
        this.author = author;  
    }  
  
    public boolean equals(Object obj) {  
        if (this == obj) return true;  
        if (obj == null || getClass() != obj.getClass()) return false;  
        Book book = (Book) obj;  
        return isbn == book.isbn;  
    }  
  
    public int hashCode() {  
        return Objects.hash(isbn);  
    }  
}  
  
class Library {  
    HashSet<Book> books = new HashSet<>();  
  
    void addBook(int isbn, String title, String author) {  
        books.add(new Book(isbn, title, author));  
    }  
  
    void removeBook(int isbn) {  
        books.removeIf(book -> book.isbn == isbn);  
    }  
  
    void displayBooks() {  
        if (books.isEmpty()) {  
            System.out.println("No books available");  
        } else {  
            for (Book book : books) {  
                System.out.println("ISBN: " + book.isbn + ", Title: " + book.title + ",  
Author: " + book.author);  
            }  
        }  
    }  
}
```

```
        }
    }
}

class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

## 2. Problem Statement

Tony is an e-learning platform administrator, he oversees the user ratings for various online courses offered in the platform.

To enhance user experience, you should assist him in utilizing a HashMap to store course ratings given by learners. Regularly, he analyzes this data to identify the highest and lowest-rated courses, enabling targeted improvements and ensuring the quality of the educational content. This process assists in maintaining a competitive and engaging online learning environment for the users.

**Input Format**

The input consists of a string representing the course name followed by a double value representing the course's rating, in separate lines.

The input is terminated by entering "done".

### ***Output Format***

The first line of output prints the string "Highest Rated Course: " followed by the highest-rated course.

The second line prints the string "Lowest Rated Course: " followed by the lowest-rated courses.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: DSA

4.0

OOPS

4.2

C

3.2

done

Output: Highest Rated Course: OOPS

Lowest Rated Course: C

### ***Answer***

```
import java.util.HashMap;
import java.util.Map;
import java.util.Scanner;

class CourseAnalyzer {
    public Map<String, String>
identifyHighestAndLowestRatedCourses(Map<String, Double> courseRatings) {
        double highestRating = Double.MIN_VALUE;
        double lowestRating = Double.MAX_VALUE;
        String highestRatedCourse = "";
        String lowestRatedCourse = "";

        for (Map.Entry<String, Double> entry : courseRatings.entrySet()) {
```

```
String course = entry.getKey();
double rating = entry.getValue();

if (rating > highestRating) {
    highestRating = rating;
    highestRatedCourse = course;
}
if (rating < lowestRating) {
    lowestRating = rating;
    lowestRatedCourse = course;
}

Map<String, String> result = new HashMap<>();
result.put("highest", highestRatedCourse);
result.put("lowest", lowestRatedCourse);
return result;
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        Map<String, Double> courseRatings = new HashMap<>();

        while (true) {
            String courseName = scanner.nextLine();
            if (courseName.equalsIgnoreCase("done")) {
                break;
            }
            double rating = Double.parseDouble(scanner.nextLine().trim());
            courseRatings.put(courseName, rating);
        }

        CourseAnalyzer analyzer = new CourseAnalyzer();
        Map<String, String> result =
analyzer.identifyHighestAndLowestRatedCourses(courseRatings);

        System.out.printf("Highest Rated Course: %s\n", result.get("highest"));
        System.out.printf("Lowest Rated Course: %s", result.get("lowest"));

        scanner.close();
    }
}
```

}

### 3. Problem Statement

Arjun is working on a program that checks if one set of numbers is a subset of another. If Set B is a subset of Set A, the program should print "YES" followed by the sorted elements of Set B. If Set B is not a subset of Set A, the program should print "NO" followed by the average of all elements from both sets combined, rounded to two decimal places.

Implement a class Solution with the required method to perform the subset check using TreeSet in Java.

#### ***Input Format***

The first line contains an integer n - the number of elements in Set A.

The second line contains n space-separated integers - the elements of Set A.

The third line contains an integer m - the number of elements in Set B.

The fourth line contains m space-separated integers - the elements of Set B.

#### ***Output Format***

If Set B is a subset of Set A, print "YES" followed by the sorted values of Set B.

Otherwise, print "NO" followed by the average of all numbers in both sets (rounded to two decimal places).

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 5

1 2 3 4 5

3

2 3 5

Output: YES 2 3 5

### Answer

```
import java.util.*;  
  
class Solution {  
    public static void checkSubset(TreeSet<Integer> setA, TreeSet<Integer> setB,  
int totalElements, double sum) {  
    if (setA.containsAll(setB)) {  
        System.out.print("YES ");  
        for (int num : setB) {  
            System.out.print(num + " ");  
        }  
        System.out.println();  
    } else {  
        double average = sum / totalElements;  
        System.out.printf("NO %.2f%n", average);  
    }  
}  
}  
  
class Main {  
    public static void main(String[] args) {  
        Scanner sc = new Scanner(System.in);  
        int n = sc.nextInt();  
        TreeSet<Integer> setA = new TreeSet<>();  
        long sum = 0;  
        for (int i = 0; i < n; i++) {  
            int num = sc.nextInt();  
            setA.add(num);  
            sum += num;  
        }  
        int m = sc.nextInt();  
        TreeSet<Integer> setB = new TreeSet<>();  
        for (int i = 0; i < m; i++) {  
            int num = sc.nextInt();  
            setB.add(num);  
            sum += num;  
        }  
        Solution.checkSubset(setA, setB, n + m, sum);  
        sc.close();  
    }  
}
```

}

#### 4. Problem Statement

A college professor wants to keep track of students who attend classes. Each student has a unique roll number and their attendance count increases every time they attend a class. The system should allow adding a student, marking their attendance, and displaying all students with their total attendance.

Your task is to implement a Java program using TreeSet to maintain students in sorted order of roll numbers and track their attendance count.

Operations:

A roll\_no name Add a student with roll number and name (if not already added).M roll\_no Mark attendance for the student with the given roll number (increase their count by 1).D Display all students in ascending order of roll number along with their attendance count.

#### *Input Format*

The first line contains an integer N - the number of students.

The next N lines contain one of the following commands:

A roll\_no name

M roll\_no

D

- A (Add) Adds a new student with a unique roll number and name.
- M (Mark) Increases attendance count for the given roll number.
- D (Display) Prints all students in ascending order of roll number.

#### *Output Format*

For D, output prints each student's roll number, name, and attendance count in ascending order of roll number.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5

A 101 Alice

A 102 Bob

M 101

M 101

D

Output: 101 Alice 2

102 Bob 0

### **Answer**

```
import java.util.*;
class Student implements Comparable<Student> {
    int rollNo;
    String name;
    int attendance;

    public Student(int rollNo, String name) {
        this.rollNo = rollNo;
        this.name = name;
        this.attendance = 0;
    }

    public void markAttendance() {
        this.attendance++;
    }

    public int compareTo(Student s) {
        return Integer.compare(this.rollNo, s.rollNo);
    }

    public boolean equals(Object obj) {
        if (this == obj) return true;
        if (obj == null || getClass() != obj.getClass()) return false;
        Student student = (Student) obj;
        return rollNo == student.rollNo;
    }
}
```

```
public int hashCode() {
    return Objects.hash(rollNo);
}

public String toString() {
    return rollNo + " " + name + " " + attendance;
}
}

class AttendanceTracker {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        sc.nextLine();
        TreeSet<Student> students = new TreeSet<>();
        for (int i = 0; i < n; i++) {
            String[] command = sc.nextLine().split(" ");
            String operation = command[0];

            if (operation.equals("A")) {
                int rollNo = Integer.parseInt(command[1]);
                String name = command[2];
                students.add(new Student(rollNo, name));
            }
            else if (operation.equals("M")) {
                int rollNo = Integer.parseInt(command[1]);
                for (Student s : students) {
                    if (s.rollNo == rollNo) {
                        s.markAttendance();
                        break;
                    }
                }
            }
            else if (operation.equals("D")) {
                for (Student s : students) {
                    System.out.println(s);
                }
            }
        }
        sc.close();
    }
}
```

}
